

EAST GRINSTEAD  
URBAN DISTRICT COUNCIL.

A N N U A L R E P O R T  
of the  
ACTING MEDICAL OFFICER OF HEALTH  
For the Year 1944.

By  
WILLIAM B. STOTT  
L.R.C.P. & S. (Edin.), D.P.H. (Camb.).

URBAN DISTRICT COUNCIL OF EAST GRINSTEAD.

REPORT OF THE ACTING MEDICAL OFFICER OF HEALTH.

To the Chairman and Members of the East Grinstead Urban District Council.

I have the honour to submit my Annual Report for the year 1944.

The Crude Death Rate is 15.23 as compared with 16.5 for the previous year, and with 11.6 for England and Wales. The Infant Mortality Rate is 28.09 which is considerably lower than that for the country as a whole.

No deaths occurred from Typhoid Fever, Scarlet Fever, Whooping Cough or Diphtheria.

DIPHTHERIA IMMUNISATION.

Every effort was made during the year to persuade parents to accept immunisation for their children and the procedure adopted is set out below.

A complete card index system ensures that every child up to fifteen years of age is recorded, particulars of births being obtained from the Registrar and checked by lists of the 'under fives' from the Food Office. Every parent, on the child's first Birthday, receives a birthday card and an explanatory leaflet with a stamped acceptance card enclosed for return. Lists of those who do not reply or refuse are sent to the British Red Cross Society who have kindly agreed to co-operate in the scheme by arranging for certain members to visit and endeavour to obtain the necessary acceptances.

The same procedure is adopted for new entrants into the district. Monthly Clinics are held at the County Council Clinic, Moat Road.

With regard to school children a complete list is

obtained from the Head Teacher, and every term the list is revised by obtaining particulars of entrants and leavers. Parents whose children have not been immunised receive the explanatory leaflet, and are visited if they do not accept. An endeavour is made to hold clinics every term in each school, parents being notified accordingly.

The prophylactic used is A.P.T., the dosage being .3 cc. followed by the same dose four weeks later.

Every parent is given the opportunity of having her child Schick tested three to six months after the second injection. In addition, every inoculated child is re-tested on entering school unless the inoculation and test has been carried out during the previous twelve months.

In order to ensure uniformity, all testing is carried out by one general practitioner, Dr. A.C. Sommerville, who attends at Clinics arranged by this office.

My best thanks are due to Dr. A.C. Sommerville for his unfailing attendance at the Clinics, and also to the British Red Cross Society for visiting and persuading parents to have their children immunised.

During the year 526 children were immunised and 546 Schick Tested. At the end of the year the estimated number of children 1-5 years of age was 645, and the estimated number immunised was 91%. The estimated number of children in the 5-15 years group was 1571, and the estimated number immunised was 89%. Two cases of Diphtheria occurred during the year, one a child evacuated to this district who had not been immunised, and the other an adult.

#### SCABIES.

By an Order made by the East Grinstead Urban District Council and approved by the Ministry of Health, under Section 147

of the Public Health Act, 1936, Scabies became a notifiable disease within the area of the said Council, such Order taking effect from 11th September, 1944.

Appended below are details of cases which received treatment at the Council's Cleansing Centre during the year.

<u>Male.</u>		<u>Female.</u>	
<u>Under 15.</u>	<u>Over 15.</u>	<u>Under 15.</u>	<u>Over 15.</u>
6	1	6	7

Seven Contacts of the above cases also received treatment at the Council's Cleansing Centre.

The routine procedure is a hot bath followed by an application of Benzyl Benzoate on two consecutive days. Contacts of cases also receive this treatment.

#### MILK SUPPLIES

Houscholders who were taking tuberculin tested or pasteurised milk before the introduction of the milk rationalization scheme have been forced to take it from the retailer with whom they are registered, and he in turn has to obtain it in bottles from a producer or retailer who has a special designations licence. This has resulted in some cases in the milk being at least 24 hours old on delivery to the consumer.

The Government's policy outlined in 1943 was that in areas where the rationalization scheme was in force all milk sold was to be heat-treated unless it came from tuberculin tested herds or was accredited milk from single herds. Areas were to be specified as and when plants became available but at the time of writing no intimation has been received in respect of this district. It is hoped that all milk in this district will be pasteurised, with the exception of those mentioned, in the near future, as the present position is far from satisfactory.

The Council is already aware that some months of delay

occurred in obtaining supplies of designated milk for its Isolation Hospitals. The matter was taken up with the local Member of Parliament and, as a result, some locally produced tuberculin tested milk was retained in the district.

The standard adopted is that samples which pass the methylene blue test have counts of under 200,000 bacteria per c.c. and with absence of coliform organisms in 1/100th c.c. are considered to be satisfactory.

During the year 13 samples of milk were submitted for biological examination and all were reported to be negative.

Eighteen samples of milk were submitted for bacteriological examination. Of these four were found to be unsatisfactory.

- |    |   |           |
|----|---|-----------|
| a) | Coliform organisms in less than 1/10 c.c.....   | 1.        |
| b) | Plate Count of over 200,000 bac teria per c.c.. | -         |
| c) | Unsatisfactory Plate Count and Coliform .....   |           |
|    | Organisms in less than 1/10 c.c.....            | 3.        |
|    |   | <u>4.</u> |

#### HOUSING.

Both in this and the preceding year, enemy action caused grave damage to large numbers of dwellings.

Repairs to bomb damage and repair of housing defects was in many cases inseparable and the work of the Department on housing defects simple was, of necessity, confined to major items.

#### WATER SUPPLIES.

Of 2,920 households, 2,800 or 96% have piped supplies from the East Grinstead Gas and Water Company, and, of these, not exceeding 1% are supplied from standpipes.

The remaining 120 households, 4% of the total, are from estate supplies (piped) and from private wells.

Owing to the very dry spring and early summer and to extra large calls for military purposes, it was necessary for the supplying Company to restrict the use of water during the months of June to September.

Having this shortage in mind, the Company took immediate steps to obtain increased supplies.

Monthly samples are taken alternately from their three sources of supply by the Company, i.e. from Hackenden, Forest Row and Placelands. This sampling is implemented by the Urban Council who, in conjunction with the Uckfield Rural District Council, also take four samples per year from each of the above three supplies.

The samples are for both bacteriological and chemical analysis and all have been found satisfactory.

My thanks are due to Mr. W.H. Dunham, Sanitary Inspector, for his help and co-operation in the work of the department and for his assistance in compiling this Report.

I have the honour to be, ladies and gentlemen,

Your obedient servant,

W.B. Stott.

Acting Medical Officer of Health.

INFESTATION - BED BUGS.

Two cases only of infestation with bed bugs occurred during the year, both of which were in private houses not owned by the Council. Treatment was as in former years, that is, severe infestation is dealt with by private contracts, contractors using Cyanide Gas. Minor infestations are dealt with by the Public Health Department, the gas used being Sulphur Dioxide.
